BISOS User Guide

1. Introduction

The Branch Inventory and Sales Optimization System (BISOS) is a web-based platform developed to help informal supermarkets and retail businesses operating across multiple branches manage their daily activities more effectively. The system allows users to maintain product records, monitor stock levels, track sales, manage store branches, and control user access based on assigned roles.

BISOS aims to simplify inventory and sales management by bringing important business information together in one central system. This helps business owners and employees keep track of operations, identify stock shortages, and make informed decisions.

2. Getting Started

2.1 System Requirements

Before using BISOS, ensure that you have the following:

- A modern web browser, such as Google Chrome, Microsoft Edge, Safari, or Mozilla Firefox.
- A reliable internet connection.
- Valid login details supplied by the system administrator, if an account has already been created.

2.2 Logging In

To access the BISOS system, follow these steps:

1. Open your web browser and navigate to the BISOS login page.
2. Enter your registered email address and password.
3. If you want the system to remember your login session, select the **Remember Me** option.
4. Click **Sign In** to access your account.
5. If enabled, you can also log in using your Google or Microsoft account through the available single sign-on options.

BISOS also provides a **Use Demo Account** option on the login screen. This allows users to explore the system using sample data without having to set up a regular account first.

2.3 Creating a New Account

Users who do not have an existing account can register through the system by following these steps:

1. Open the login page and click **Register Here**.
2. Enter your first name, last name, email address, and phone number.
3. Select the appropriate user role from the dropdown menu, such as Manager or Clerk.
4. Create a password containing at least eight characters and enter it again to confirm.

5. Read and accept the Terms of Service.
6. Click **Create Account** to complete the registration process.

Once registration is complete, you can use your account details to sign in to the system.

3. Navigating the System

BISOS uses a top navigation bar to help users move between the different sections of the application. Each section provides access to a specific set of functions.

- **Dashboard:** Displays a summary of business performance, including sales figures, stock information, and recent activities.
- **Stocks:** Allows users to monitor inventory quantities, update stock records, and identify items that need replenishment.
- **Products:** Provides tools for adding, editing, searching, and managing product information.
- **Reports:** Displays sales and financial information for selected periods.
- **Alerts:** Shows notifications for products that have reached low or critical stock levels.
- **Stores:** Supports the management and monitoring of multiple business branches.
- **Settings:** Allows users to update account details, configure system preferences, manage notifications, and review user accounts.

4. Using the Different Modules

4.1 Dashboard

The dashboard gives users an overview of the business as soon as they log in. It presents important information in a simple format, making it easier to monitor daily operations.

The main dashboard features include:

- **Performance metrics:** Displays the total number of stores and products, the number of low-stock alerts, critical stock items, and sales recorded for the current day. It may also show the percentage change in daily sales.
- **Charts and graphs:** The monthly revenue chart helps users track sales performance over time, while the stock-by-category chart shows how inventory is distributed across product categories.
- **Recent activity:** Provides a record of recent system events, such as stock updates, newly triggered alerts, and completed sales transactions.
- **Quick actions:** Offers shortcuts for common tasks, including adding products, placing stock reorders, generating reports, and managing store branches.

These features allow users to identify important changes and access frequently used functions without navigating through several pages.

4.2 Product Management

The Products module is used to maintain the business's product catalogue. To access it, select the **Products** tab from the navigation bar.

The product list displays essential information for each item, including its name, category, barcode, cost price, selling price, profit margin, and whether it is perishable.

Users can perform the following actions:

- **Search and filter products:** Use the search bar to find a specific product or select a category from the dropdown menu to narrow the results.
- **Add a product:** Click **+ Add Product**, enter the required product details, and save the information.
- **Edit or delete products:** Use the relevant action icons in the product table to update product details or remove an item from the catalogue.
- **Export product information:** Select the **Export** option to download a copy of the product list for record-keeping or further analysis.

Keeping product information up to date helps ensure that stock records and sales information remain consistent.

4.3 Stock Management

The Stocks module helps users monitor inventory across the business. It displays the quantity available for each product alongside its reorder level, making it easier to identify items that require attention.

Stock levels are indicated using colour-coded status labels:

- **Critical (red):** Indicates that an item's stock level requires urgent attention.
- **Low (orange):** Shows that the available quantity is approaching or has reached the reorder threshold.
- **OK (green):** Indicates that the current stock level is acceptable.

To manage inventory, users can:

1. Open the **Stocks** tab.
2. Review the available quantities and their corresponding stock statuses.
3. Click **+ Add New Stock** to record incoming inventory.
4. Select the edit icon beside a product to adjust its quantity or update its storage location.
5. Click **Export CSV** to download the current stock report.

Regularly updating stock information helps reduce the risk of running out of popular products and makes inventory monitoring more reliable.

4.4 Low-Stock Alerts

The Alerts module notifies users when products require restocking. It helps staff and managers identify inventory shortages before they significantly affect business operations.

At the top of the page, summary cards display the number of pending alerts, critical stock items, and alerts resolved during the current day.

Users can manage these notifications through the following features:

- **Alert filters:** Switch between All, Pending, Acknowledged, and Resolved to view alerts according to their current status.
- **Individual actions:** Click **Reorder** next to a product to initiate the restocking process.
- **Bulk actions:** Use the available options to acknowledge all alerts, resolve all alerts, or place reorders for multiple items at once.

Managing alerts regularly helps ensure that stock shortages are identified and addressed promptly.

4.5 Sales Reports

The Reports module provides information about sales activity and transaction performance. Users can select a reporting period and apply filters to view the information most relevant to their needs.

To generate a report:

1. Open the **Reports** tab.
2. Choose a reporting period: Daily, Weekly, Monthly, or Custom Range.
3. If using a custom range, specify the start date in the **From** field and the end date in the **To** field.
4. Apply filters to display results for a particular store or payment method, such as cash, card, or mobile payment.
5. Review the displayed sales information and transaction records.

The report summarises important performance indicators, including total sales, the number of transactions, the average transaction value, and the breakdown of payments by method.

A detailed transaction table appears further down the page. It contains information such as transaction ID, date, product name, quantity sold, unit price, total amount, payment method, and store.

Users can download the report by selecting **Export PDF** or **Export CSV**, depending on how they want to save or use the information.

4.6 Store Management

The Stores module allows users to manage the different branches of a retail business from one central location.

Each store is displayed in a card containing key information, such as its address, contact details, manager's name, product count, current alerts, and sales for the day.

The available actions include:

- **View Stock:** Opens the inventory associated with the selected branch.
- **Edit:** Allows users to update the store's information.
- **+ Add Store:** Provides a way to register a new branch in the system.

This module helps managers monitor individual branches and compare their activities without having to access each store separately.

4.7 Settings

The Settings section allows users to manage their account information and adjust system preferences. It can be accessed through the **Settings** tab or the user profile menu.

The section contains several categories:

- **Profile:** Allows users to update their name, email address, and phone number.
- **Notifications:** Provides options for enabling or disabling email notifications for low stock, SMS notifications for critical stock, and daily sales summaries.
- **Security:** Allows users to change their account password.
- **System preferences:** Enables users to select the default currency, such as South African rand (ZAR), and configure the system timezone, such as Africa/Johannesburg.
- **User management:** Displays registered users, their assigned roles, and whether their accounts are active.

These settings help users personalise their experience while supporting the management of accounts and system behaviour.

WEBSITE UI

1. Design System and Style Guide

This section describes the visual design principles used throughout BISOS. The interface is designed to provide a consistent, organised, and user-friendly experience. Its colours, typography, layout, and reusable components help users navigate the system and understand information quickly.

1.1 Colour Palette

BISOS uses a combination of dark blue, bright blue, and neutral colours to distinguish different interface elements and communicate system status.

The main colours include:

- **Primary brand colour — Deep Navy Blue (#1E293B):** Used for headers, important text, and primary interface elements.
- **Secondary brand colour — Bright Blue (#3B82F6):** Used for links, highlighted elements, active navigation items, and other interactive features.
- **Success colour — Green (#10B981):** Represents positive outcomes and normal stock levels. It is also used for the CSV export button.
- **Danger colour — Red (#EF4444):** Indicates critical situations and destructive actions, such as deleting a record. It is also used for the PDF export button.
- **Warning colour — Orange/Yellow (#F59E0B):** Highlights low-stock conditions and other situations that require attention.
- **Main background — Light Grey (#F3F4F6):** Provides a neutral background for the application's content.
- **Card and panel background — White (#FFFFFF):** Used for tables, cards, forms, and modal windows.
- **Primary text — Dark Slate (#1F2937):** Used for the main content and headings.
- **Secondary text — Muted Grey (#6B7280):** Used for labels, descriptions, and less prominent information.

This colour scheme creates a clear visual hierarchy and allows users to recognise important actions and stock conditions more easily.

1.2 Typography

The interface uses a sans-serif font to maintain a clean, modern appearance and ensure that text remains readable across different devices. Suitable font choices include Inter, Roboto, or the browser's default system font.

Typography is applied consistently throughout the application:

- **Headings:** Displayed in bold text, generally using dark navy to distinguish section titles.
- **Body text:** Uses a regular font weight and dark grey colouring for comfortable reading.

- **Table headings:** Presented in smaller uppercase text with muted grey colouring to separate column labels from the information below them.

The consistent use of font sizes, weights, and colours helps users distinguish headings, descriptions, and data at a glance.

1.3 Layout and Grid Structure

BISOS follows a structured layout that keeps navigation and content organised.

Header and navigation bar: A fixed navigation bar appears at the top of the interface. It contains the BISOS logo, links to the main modules, a notification bell, and the user's profile avatar.

Main content area: The central section uses a container with a maximum width and consistent spacing. Information is arranged in cards, tables, and grouped panels to improve readability.

Footer: A dark navy footer appears at the bottom of the interface. It includes copyright information, developer credits, and links to the Privacy Policy, Terms of Service, and Support.

Together, these elements create a consistent layout across the different pages of the application.

2. User Interface Components

2.1 Navigation Elements

The navigation system allows users to move between the main modules and access related functions within each section.

- **Top navigation:** Uses horizontal text links accompanied by icons. The currently selected section is highlighted with a solid blue background and white text.
- **Sub-navigation and tabs:** Used for switching between related views, such as Daily, Weekly, and Monthly reports. These controls have rounded, pill-shaped designs, with the active option distinguished by a white background and subtle shadow.

These visual indicators help users identify their current location within the system.

2.2 Buttons

Buttons are designed to make available actions easy to recognise and use.

- **Primary buttons:** Use a solid navy or blue background, white text, and slightly rounded corners of approximately 6 pixels. They are intended for important actions, such as adding a product or creating a store.
- **Secondary buttons:** Use a white background with a grey border and dark text. They are suitable for actions such as editing records or accessing additional options.
- **Table action buttons:** Small icon-based controls are placed within table rows to allow users to edit or delete individual records.
- **Export buttons:** Include an icon and descriptive text. Different colours distinguish export formats, with red used for PDF and green for CSV.

The use of consistent button styles helps users understand the purpose of each action.

2.3 Tables

Tables are used to display structured information, particularly in the product, stock, and sales modules.

The table design includes the following features:

- A simple layout with horizontal lines separating rows.
- Light grey backgrounds for column headings.
- Subtle hover effects that make individual rows easier to follow.
- Pagination controls positioned at the bottom-right of the table.
- Rounded status badges that communicate important information, such as whether a product is perishable or whether its stock level is Low, OK, or Critical.

These features make large amounts of information easier to scan and manage.

2.4 Cards and Dashboard Widgets

Cards and widgets are used to group related information and highlight important business figures.

Metric cards: These cards have a white background, a subtle shadow, a small descriptive label, and a large bold number. Where relevant, they also display a trend indicator, such as a percentage increase compared with the previous day.

Store cards: Each card represents a particular branch and includes a coloured header or banner that reflects its visual theme or status. Store information and key performance figures are arranged within the card.

Dashboard charts: The dashboard includes bar charts for tracking revenue and donut charts for showing stock distribution by category. The charts use a clean design with minimal grid lines and may provide interactive tooltips to display additional information when users interact with them.

These components allow users to understand key business information without having to examine detailed tables.

2.5 Forms and Input Fields

Forms are used for entering and updating information throughout the system, including login details, product records, store information, and account settings.

The main input components include:

- **Text fields:** Use a white background, a light grey border, rounded corners, and placeholder text to guide users. Relevant icons, such as an envelope for email or a lock for passwords, may appear inside the fields.
- **Dropdown menus:** Allow users to select from predefined options and include a downward-facing arrow to indicate that more choices are available.
- **Toggle switches:** Use an iOS-style design for settings that can be switched on or off, particularly notification preferences.

- **Input validation:** Invalid entries are expected to be highlighted with red borders and explanatory error messages, helping users identify and correct mistakes.

These design choices make forms easier to understand and reduce confusion during data entry.

3. Screen-by-Screen Interface Breakdown

3.1 Login and Registration Screen

The login and registration pages use a simple, centred layout with a narrow form card placed against a dark navy background.

The design focuses on keeping the authentication process straightforward and free from unnecessary distractions. Input fields are arranged clearly, with the relevant labels and controls grouped together.

Where applicable, demo account information is displayed inside a grey box near the bottom of the login screen. This gives users a convenient way to explore the system without using a regular account.

3.2 Dashboard Screen

The dashboard is arranged to display important business information in a structured and accessible format.

The top section contains four metric cards arranged in a four-column grid. These cards summarise key figures, such as the number of stores, total products, low-stock alerts, and daily sales.

Below the metrics, the chart section is divided into two areas:

- The monthly revenue bar chart occupies approximately two-thirds of the available width.
- The stock-by-category donut chart occupies the remaining one-third.

The bottom section contains the recent activity feed alongside a grid of quick-action shortcuts.

This layout prioritises important information while giving users direct access to frequently used functions.

3.3 Product and Stock Management Screens

The Products and Stocks pages use a full-width content card to display inventory-related information.

Above the main table, users can access a search field and relevant filter dropdowns. The primary action buttons, including options to add records and export information, are positioned above the table, typically on the right-hand side.

The table provides a structured view of the available records, while action icons allow users to make changes to individual entries.

This design keeps search tools, data, and common actions together in one area, making inventory management more efficient.

3.4 Sales Reports Screen

The Sales Reports page is organised into sections that guide users from selecting report criteria to reviewing detailed transaction information.

The top section contains date-range controls and dropdown menus for filtering results by store or payment method.

The middle section displays three metric cards containing the main sales indicators. A separate row presents the breakdown of sales by payment method.

At the bottom of the page, a detailed transaction table lists individual sales records and their associated information.

This arrangement allows users to review overall performance first and then examine individual transactions when more detail is needed.

3.5 Settings Screen

The Settings page uses a two-column layout to organise account and system preferences.

A sidebar on the left displays the available settings categories, including Profile, Notifications, Security, System, and User Management.

When a user selects a category, the corresponding form, configuration options, or user table appears in the main panel on the right.

This layout keeps the settings menu visible while users make changes, making it easier to switch between categories without losing their place.

MOBILE APP USER DOCUMENTATION

1. Introduction

Welcome to **Informal Mart**, a mobile application designed to make managing a small business easier. The app allows store owners to keep track of their stock, record sales, monitor products that are running low, and generate sales reports. This user guide explains how to use the main features of the application to help you manage your store more effectively.

2. Getting Started

2.1 Creating an Account

Before using Informal Mart, you need to create an account. Follow these steps to get started:

1. Open the application to access the registration screen.
2. Enter your full name in the required field.
3. Provide a valid email address.
4. Create a password to protect your account.

5. Tap the **Create Account** button to complete the registration process and continue to the main dashboard.

3. Navigating the Application

Informal Mart has a bottom navigation bar that allows you to move between the five main sections of the app.

- **Home:** Displays an overview of your store's activities and important information.
- **Stock:** Allows you to view and manage your inventory.
- **Sales:** Shows a list of recent sales transactions.
- **Reports:** Provides sales summaries and options for generating reports.
- **Settings:** Allows you to manage your account details and application preferences.

4. Features and How to Use Them

4.1 Home (Dashboard)

The Home screen gives you a quick overview of how your business is performing. It displays important information that helps you keep track of your daily activities.

- **Business Overview:** View the total stock available, the number of low-stock alerts, and the sales recorded for the current day.
- **Quick Actions:** Use the shortcut buttons to view your inventory, add stock, check recent sales, or review low-stock alerts.
- **Low-Stock Notifications:** Scroll down to see products that may need restocking, such as fresh milk and rice. Select **View All** to access the complete list of items that require attention.

4.2 Stock (Inventory)

The Stock section helps you manage the products available in your store.

1. Select **Stock** from the bottom navigation menu.
2. Browse the products displayed in a grid. Each product card shows the product name, selling price, and current stock quantity.
3. Check the stock indicators. Items displayed in red are running low and may need to be restocked.
4. Tap the **+ (Plus)** icon in the top-right corner to add a new product or update your inventory, depending on the available options.

Keeping your inventory up to date helps you identify products that are selling quickly and avoid running out of essential items.

4.3 Sales

The Sales section allows you to review recent transactions and see how much revenue each sale has generated.

1. Tap **Sales** on the bottom navigation bar.
2. View the list of recent transactions, including products such as bread and fresh milk.
3. Each entry displays the product name, quantity sold, and total amount generated by that sale.

The information in this section helps you monitor sales activity and keep track of the products customers are purchasing.

4.4 Reports

The Reports section helps you review your sales performance and create reports for record-keeping purposes.

1. Select **Reports** from the bottom navigation menu.
2. **Choose a Date:** Use the date picker to select the day for which you want to view sales information.
3. **Review the Summary:** The summary cards display the total sales amount, the number of transactions, and the average value per sale.
4. **Check the Sales Table:** View a detailed breakdown of the products sold, quantities, unit prices, and total amounts.
5. **Export the Report:** Tap the green **Export PDF** button to save or share the report, depending on the options supported by your device.

These reports can help you understand your store's performance and make better business decisions.

4.5 Settings

The Settings section allows you to manage your account and customise certain application preferences.

1. Tap **Settings** on the bottom navigation bar.
2. Open **Profile Settings** to view or update your personal details, such as your name and email address.
3. Select **Notification Preferences** to manage how you receive application notifications.
4. Update your **Store Information** and choose your preferred application **Language**.
5. When you are finished using the app, select the red **Logout** option to sign out of your account.

Remember to log out when you are finished, especially if you are using a shared device.

MOBILE APP UI

1. Design System and Theme

Informal Mart uses a simple, clean interface that makes it easier for store owners to access important information without unnecessary complexity. The colours, text styles, and icons are used consistently throughout the application.

- **Primary Colour – Dark Green (#1B5E20 approximately):** Used for the top app bars, main action buttons, selected navigation items, and positive financial information. This colour creates a consistent visual identity across the app.
- **Secondary Colour – White (#FFFFFF):** Used mainly for screen backgrounds and cards, keeping the interface bright and easy to read.
- **Alert Colour – Red (#D32F2F):** Used to highlight low-stock warnings, stock quantities that need attention, and the logout option.
- **Text Colours:** Dark grey or black is used for important information, while light grey is used for secondary text, labels, and placeholder content.
- **Typography:** A sans-serif font, such as Roboto or the standard Android system font, is used to improve readability. Bold text helps important headings and numerical values stand out.
- **Icons:** Simple, flat icons are used to represent different actions and sections. The design follows a familiar Android Material-style approach to make navigation easier.

2. Common User Interface Elements

2.1 Bottom Navigation Bar

The bottom navigation bar appears across the main sections of the application, allowing users to switch between screens without having to return to the home page.

- **Structure:** The bar contains five icons, each with a label underneath: Home, Stock, Sales, Reports, and Settings.
- **Selected Tab:** The currently active section is highlighted with a light-green, pill-shaped background behind its icon. The selected icon and label also appear in dark green to show which section is open.

2.2 Top App Bar

The top app bar provides the title of the current screen and displays relevant navigation or action icons.

- **Appearance:** A dark-green background with white text is used to maintain a consistent look throughout the application.
- **Navigation:** A back arrow appears on screens where users need to return to the previous page.
- **Screen Title:** The title is positioned on the left and displayed in bold text.

- **Action Icons:** Depending on the screen, icons on the right may include a notification bell, profile icon, plus icon, or filter icon.

These elements help users identify their current location in the application and quickly access relevant actions.

3. Screen-by-Screen UI Breakdown

3.1 Registration Screen

The registration screen allows new users to create an account. Its layout is simple and centred, making the registration process straightforward.

Layout and components:

- **Top App Bar:** Displays a back arrow and the title *Register*.
- **Store Icon:** Positioned near the top centre of the screen to represent the application.
- **Input Fields:** Three rounded text fields are provided for the user's full name, email address, and password. Each field has a light-grey border and placeholder text to indicate the required information.
- **Create Account Button:** A large, full-width dark-green button with white text is positioned below the input fields.

The screen uses a single-column layout so that users can enter their details in a clear and organised manner.

3.2 Home (Dashboard) Screen

The dashboard is the main screen users see when accessing the application's core features. It provides an overview of store activity and shortcuts to frequently used functions.

Top App Bar:

- Displays the application icon and the name **Informal Mart** on the left.
- Includes a notification bell on the right, with a red dot to indicate a notification, and a profile avatar icon.

Dashboard Heading:

- The word *DASHBOARD* appears below the top bar in bold, dark-green text.

Business Summary:

Three circular indicators display key business information:

- **Total Stock:** Uses a stock-related icon to represent inventory levels.
- **Low Stock Alerts:** Uses a red warning-triangle icon to highlight products that may need restocking.
- **Today's Sales:** Uses a trending-chart icon to represent daily sales performance.

Quick Action Grid:

A two-column by two-row grid displays four white cards with subtle shadows:

- View Stock
- Add Stock, represented by a green plus icon
- View Sales, represented by a bar-chart icon
- View Alerts, represented by a bell icon

Low-Stock Alerts Section:

- Displays the heading *LOW STOCK ALERTS*.
- Includes a **View All** link on the right side of the heading.
- Shows products that need attention, with each item displaying a red warning icon, the product name, and a red stock indicator, such as 8 / 15.

This layout allows users to identify important stock issues and access common features quickly.

3.3 Stock (Inventory) Screen

The Inventory screen displays the products recorded in the store and provides access to inventory management functions.

Top App Bar:

- Contains a back arrow on the left.
- Displays the title *Inventory*.
- Includes a plus icon on the right for adding products or stock.

Product Layout:

Products are arranged in a two-column grid, with each product displayed in a separate white card. The cards have subtle shadows to distinguish them from the background.

Each product card contains:

- A product image or placeholder icon at the top.
- The product name in light-grey text, such as *Fresh Milk (2L)*.
- The selling price in dark-green text, for example, *R18.50*.
- The available stock quantity.

Stock Indicators:

Stock quantities that fall below the required level are displayed in red to draw the user's attention. Products with sufficient stock use the standard dark text colour.

For example, an item with eight units remaining may be highlighted in red, while bread with 25 units available may be displayed using the normal text colour.

This visual approach makes it easier to identify which products require restocking.

3.4 Sales (Recent Transactions) Screen

The Recent Transactions screen displays a list of recorded sales, allowing users to review their sales activity.

Top App Bar:

- Includes a back arrow on the left.
- Displays the title *Recent Transactions*.

Transaction List:

The screen uses a vertical list layout, with faint horizontal lines separating individual entries.

Each transaction contains:

- **Product Name:** Displayed on the left in bold, light-grey text.
- **Quantity Sold:** Shown below the product name in a darker text colour.
- **Total Amount:** Displayed on the right in bold, dark-green text.

The arrangement keeps product information and sales amounts easy to compare while allowing users to browse recent transactions.

3.5 Reports (Sales Report) Screen

The Sales Report screen presents sales information in a structured format, making it easier for users to review business performance and export reports.

Top App Bar:

- Contains a back arrow on the left.
- Displays the title *Sales Report*.
- Includes a filter icon on the right.

Date Selection:

A prominent, pill-shaped field displays the selected date alongside a calendar icon. Users can use this control to select the date for the sales report.

Summary Cards:

Three outlined cards appear next to one another, each displaying a key sales metric:

- **Total Sales:** Shows the total sales amount and includes a file-style icon.
- **Transactions:** Displays the number of recorded transactions alongside a shopping-cart icon.
- **Average Sale:** Shows the average value per sale with a gear-style icon.

The values are displayed in bold, dark-green text to make them easy to identify.

Sales Data Table:

A table presents the details of the products sold. Its header row has a light-grey background and contains the following columns:

- Product
- Qty
- Unit Price
- Total

The rows below display the corresponding information for each product, allowing users to review quantities, prices, and revenue.

Export Button:

At the bottom of the screen, a full-width dark-green button labelled **Export PDF** includes a PDF icon. This button allows users to export the displayed report in PDF format.

The combination of summary cards and a detailed table provides both a quick overview and a more detailed breakdown of sales.

3.6 Settings Screen

The Settings screen provides a central place for users to manage their account details and application preferences.

Top App Bar:

- Displays a back arrow on the left.
- Shows the title *Settings*.

Settings Menu:

The main content is arranged as a vertical list of options. Each row contains a grey icon on the left, a text label, and a right-facing chevron (>) to indicate that selecting the item opens another screen or menu.

The available options include:

- **Profile Settings:** Uses a user icon and allows users to manage their personal account details.
- **Notification Preferences:** Uses a bell icon and provides access to notification settings.
- **Store Information:** Uses a store icon and allows users to manage their store details.
- **Language:** Uses a settings-style icon and provides access to language preferences.

Logout Option:

A red **Logout** label appears at the bottom centre of the screen. It allows users to sign out of their accounts.
